To whom it may concern,

The team at NUS iGEM Singapore has been hard at work developing a system that can provide cells with a prolonged lifespan and protein production. We at FREDsense believe that their technology will be of use in our product, which uses cell-based biosensors for chemical detection in wastewater.

We have spoken to the team and are excited to hear of their progress. We will be willing to support them and work with them to bring their product further forward and possibly incorporate it into our own pipeline of products if they decide to continue in this endeavour.

Yours Sincerely,

Emily Hicks
